

NJFW Wild Turkey Brood Sighting Survey

Information from this wild turkey brood survey is useful as a measure of wild turkey productivity. This survey is used in New Jersey and nationally as a means of estimating how well turkeys did raising broods each year. This survey will run from June 15th - September 15th. Since hens may lose their young or may not nest at all, it is important to record lone hens as well as those with poults. To the best of your ability, each of your record entries should be of new broods when this is known. Please do not submit the same brood you see every day as a separate survey entry.

Example: If the same brood visits your backyard every day, this would be one entry for the entire period of the study.

If you cannot tell poults from hens, especially in the later months of the survey, please record them in the "unknown" section of this survey.

Each time data is submitted, via the submit button at the bottom of this screen, it is counted as a single record.

If you have any other questions or comments, please feel free to email Jimmy Sloan, NJ Fish and Wildlife Upland Game Biologist, at
